Mountain Beaver

Aplodontia rufa (olympica)

Not really a Beaver at all, the species is considered to be the most primitive rodent in existence. Originally two subspecies (*A.r.rufa* and *A.r.rainieri*) were thought to inhabit the southern Cascade Mountains and parts of the Fraser Lowlands in British Columbia, but recent genetic work suggests they should be considered one subspecies *A.r.olympica*.

Characteristics

Also referred to as “Aplodontia,” “Boomer,” “Ground Bear,” or “Giant Mole”. Mountain Beaver are primarily a fossorial (sub-surface oriented) rodent living in burrows in and near moist riparian forest communities. Most burrow colonies are in areas with proximity to a water source, well-developed, firm soils, and abundant vegetation. Little is understood about BC’s populations which are limited in distribution and subject to a number of threats from human activities including forest clearing, development, genetic isolation and domestic pet predation.

Status

Global Status:	G5
Provincial Status:	S4
SARA Status:	Special Concern
BC List Status:	Blue (Considered to be of Special Concern)

Molecular phylogeny of an ancient rodent family (Aplodontiidae)

Although we revised geographic boundaries for some groups (*A. r. rufa*, *A. r. olympica*, and *A. r. pacified*), only the conservation status and management of *A. r. olympica* (previously 2 subspecies) in Canada may be affected. Our findings support the continued conservation efforts for the isolated and endangered lineages present in coastal California.

Canada’s docile ‘living fossil’ can’t handle the heat

BC Species and Ecosystems Explorer: Species and Ecosystems Search

A source for authoritative conservation information on thousands of plants and animals and hundreds of ecological communities in BC. From here connect to all provincial and federal recovery plans (including the SARA Registry), COSEWIC (Committee on the Status of Endangered Wildlife in Canada), Identified Wildlife guidance and conservation requirements for specific species and ecological communities of conservation concern impacted by forestry activities) and links to E-Flora and E-Fauna (the Electronic Atlas of the Plants and Wildlife of British Columbia).

British Columbia’s Coast Region Species & Ecosystems of Conservation Concern

A joint venture resource providing comprehensive information on a range of species and ecological communities specific to the Coast Region of BC (including the South, Central and North Coast, Vancouver Island and Haida Gwaii).

Develop With Care Guidelines (see Lower Mainland Region section)

Environmental guidelines for urban and rural land development in BC.

Species at Risk & Local Governments a Primer for BC

Learn what species are at risk in your area, search by name, habitat type, regional district and forest district.
