Emma's Dancer

Argia emma

A member of the family Coenagrionidae (“Closed-winged, Narrow-winged” or “Pond” damselflies), with approximately 1,100 species. Members of the genus *Argia* are collectively referred to as “Dancers.” Wings are held closed and tight to the body when resting. *Argia* species are often associated with flowing water.

Female Tom Murray

Male Tom Murray

Male Ian Lane

Male Dennis Paulson

Characteristics

Length: males 3.3—3.9 cm, females 3.4—3.8 cm. Male Emma's Dancer have a violet head, thorax and abdomen with a distinct “pruinescence” (dusty or frosty appearance). The thorax has thin, black, mid-dorsal stripes (lower stripe can be broken). Each abdominal segment has a patch of black, becoming mainly black in the last two segments near the tip (violet-blue on males, tan or brown on females). Patterning on immature adults and females is similar to that of males, however violet colouration and pruinescence is lacking and body colour tends to be light brown, olive, slate or tan. The 2-2.1 cm larvae (“nymphs”), have antennae slightly longer than the head, are light brown with dark brown patterning and have light mid-dorsal and lateral striping edged with black. Damselfly larvae are more slender than those of dragonflies and have three external, feathery gills extending from the tip of the abdomen, used to breath. Dragonfly larvae have gills inside the abdomen.

Status

Global Status: G5
Provincial Status: S3S4
BC List Status: Blue (Considered to be of Special Concern)

Resources

For further information see

[Living Landscapes Royal BC Museum Dragonflies](#)
